work with D. Neuenfeld

- Construct scattering states in flat space using CFT
- Use this map to derive flat space physics from CFT
- Weinberg soft theorems from CFT Ward identities

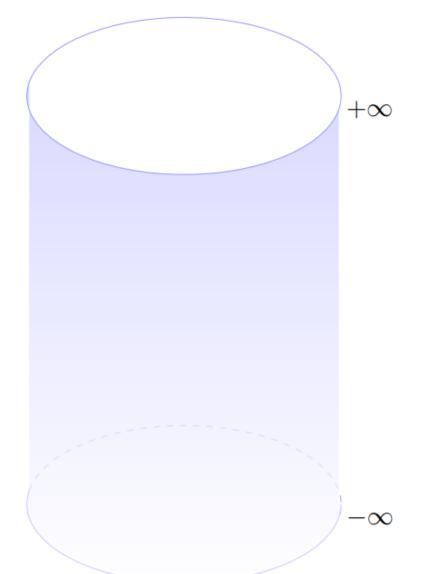

Indirect holography

 $ds^{2} = \frac{L^{2}}{\cos^{2} \rho} \left(-d\tau^{2} + d\rho^{2} + \sin^{2} \rho \, d\Omega_{d-1}^{2} \right)$

Observables in AdS vs Flat space

In the presence of gravity, diffeomorphism invariance makes it impossible to define local correlation functions.

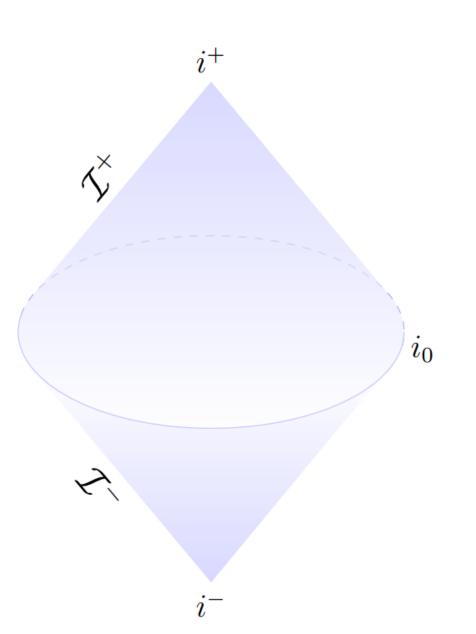

In AdS, gauge invariant observables can be defined at the boundary as conformal correlators

$$\langle \mathcal{O}_1(x_1)\mathcal{O}_2(x_2)\mathcal{O}_3(x_3)\mathcal{O}_4(x_4)\rangle$$
 operators

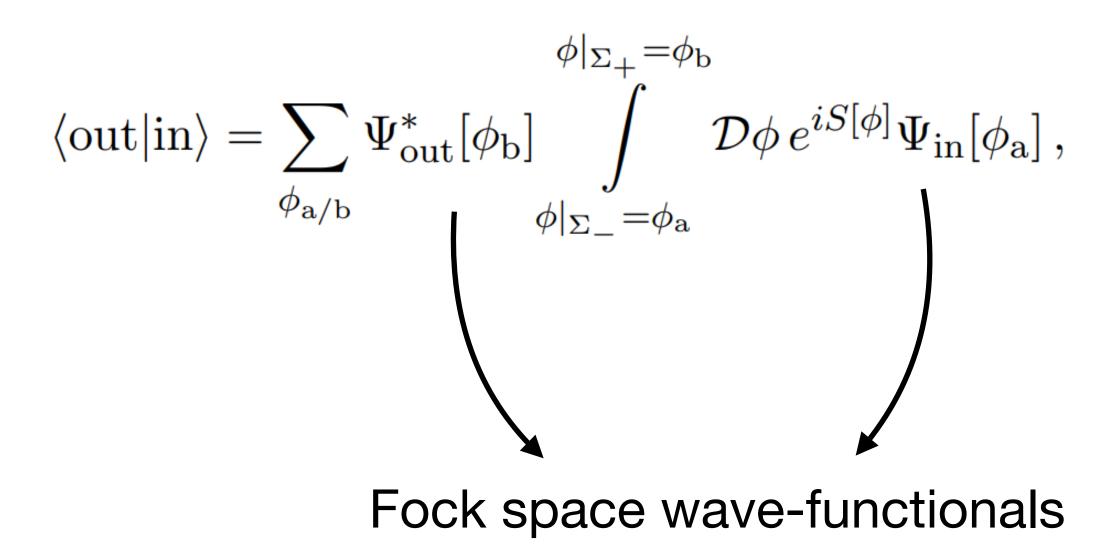

Flat space has no boundary.

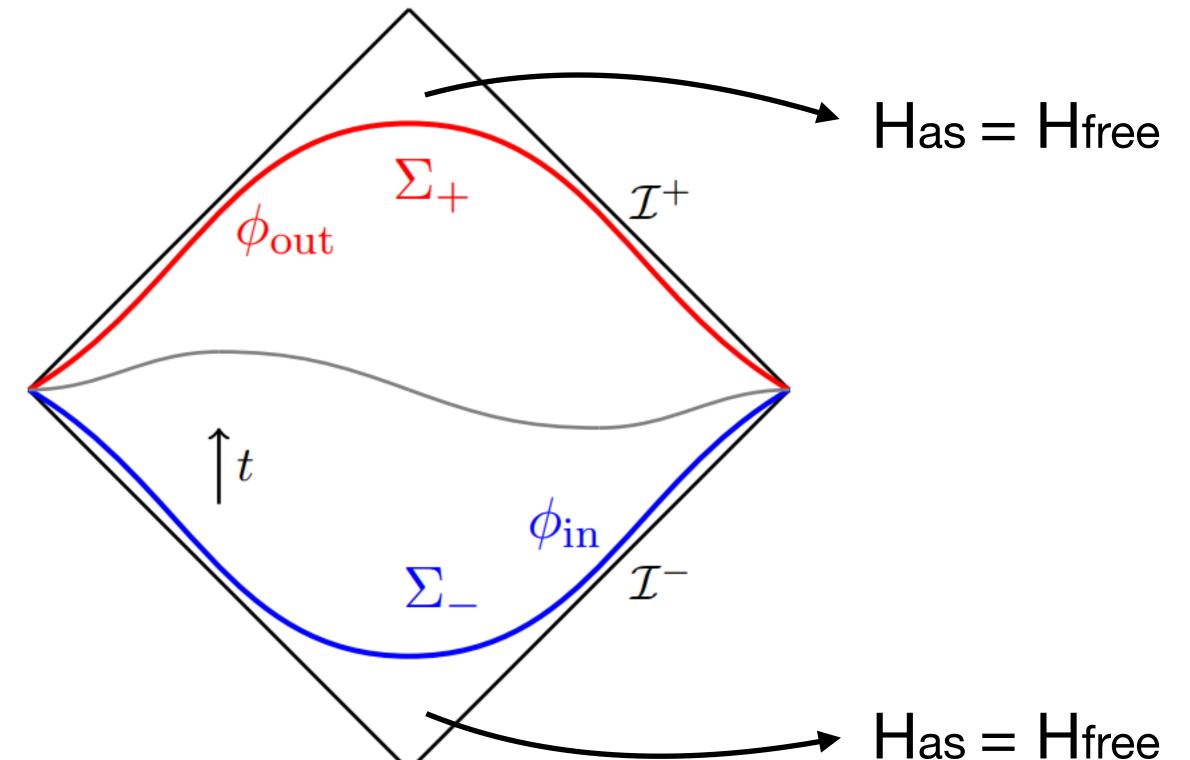

One can hope to define observables asymptotically

The only precise observable is the S-matrix

S-matrix

Objective of scattering theory: Compute overlap of two different scattering states of the **full** hamiltonian H

Such states are usually unavailable. Simpler scattering states must be used, by approximating the asymptotic Hamiltonian

Asymptotic decoupling: Asymptotic Hamiltonian is considered to be free.

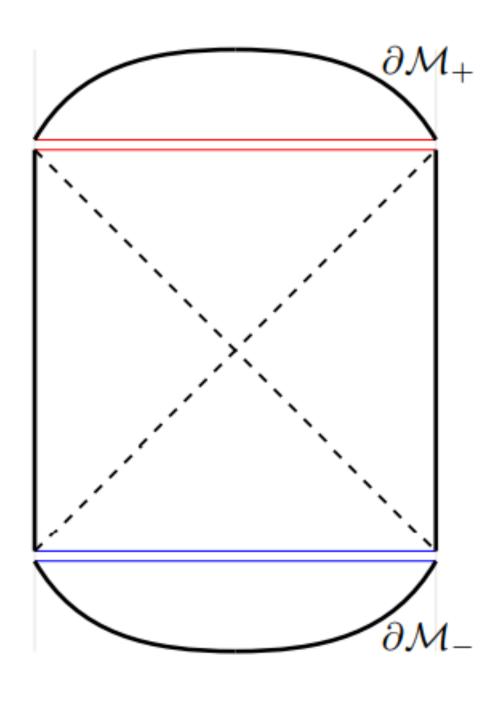

Asymptotic states form a Fock space. How do we construct these in AdS/CFT?

Extrapolate dictionary in AdS/CFT

$$\langle \operatorname{in}|e^{i\int_{\partial\operatorname{AdS}}\phi_{0}(x)\mathcal{O}(x)}|\operatorname{out}\rangle = \sum_{\phi_{a/b}}\Psi_{\operatorname{out}}^{*}[\phi_{b}]\int_{\phi|_{\Sigma_{-}^{\operatorname{AdS}}}=\phi_{a}}^{\phi|_{\Sigma_{+}^{\operatorname{AdS}}}=\phi_{b}}[\mathcal{D}\Phi]_{\phi_{0}}\,e^{iS(\phi)}\Psi_{\operatorname{in}}[\phi_{a}]\,.$$

The in/out wave-functionals can be generated with Euclidean path integrals:

$$\Psi_{\rm in}[\phi_{\rm a}] \equiv \langle \phi_{\rm a} | \Psi_{\rm in} \rangle = \int_0^{\phi_{\rm a}} [\mathcal{D}\Phi]_{\phi_i} e^{-S_{\mathcal{M}_-}[\Phi]} \,. \qquad \qquad |\Psi_i\rangle = e^{-\int_{\partial \mathcal{M}_-} \mathcal{O}\phi_i} |0\rangle$$

It is not clear how to choose sources so that the state is a Fock space state in the flat limit!

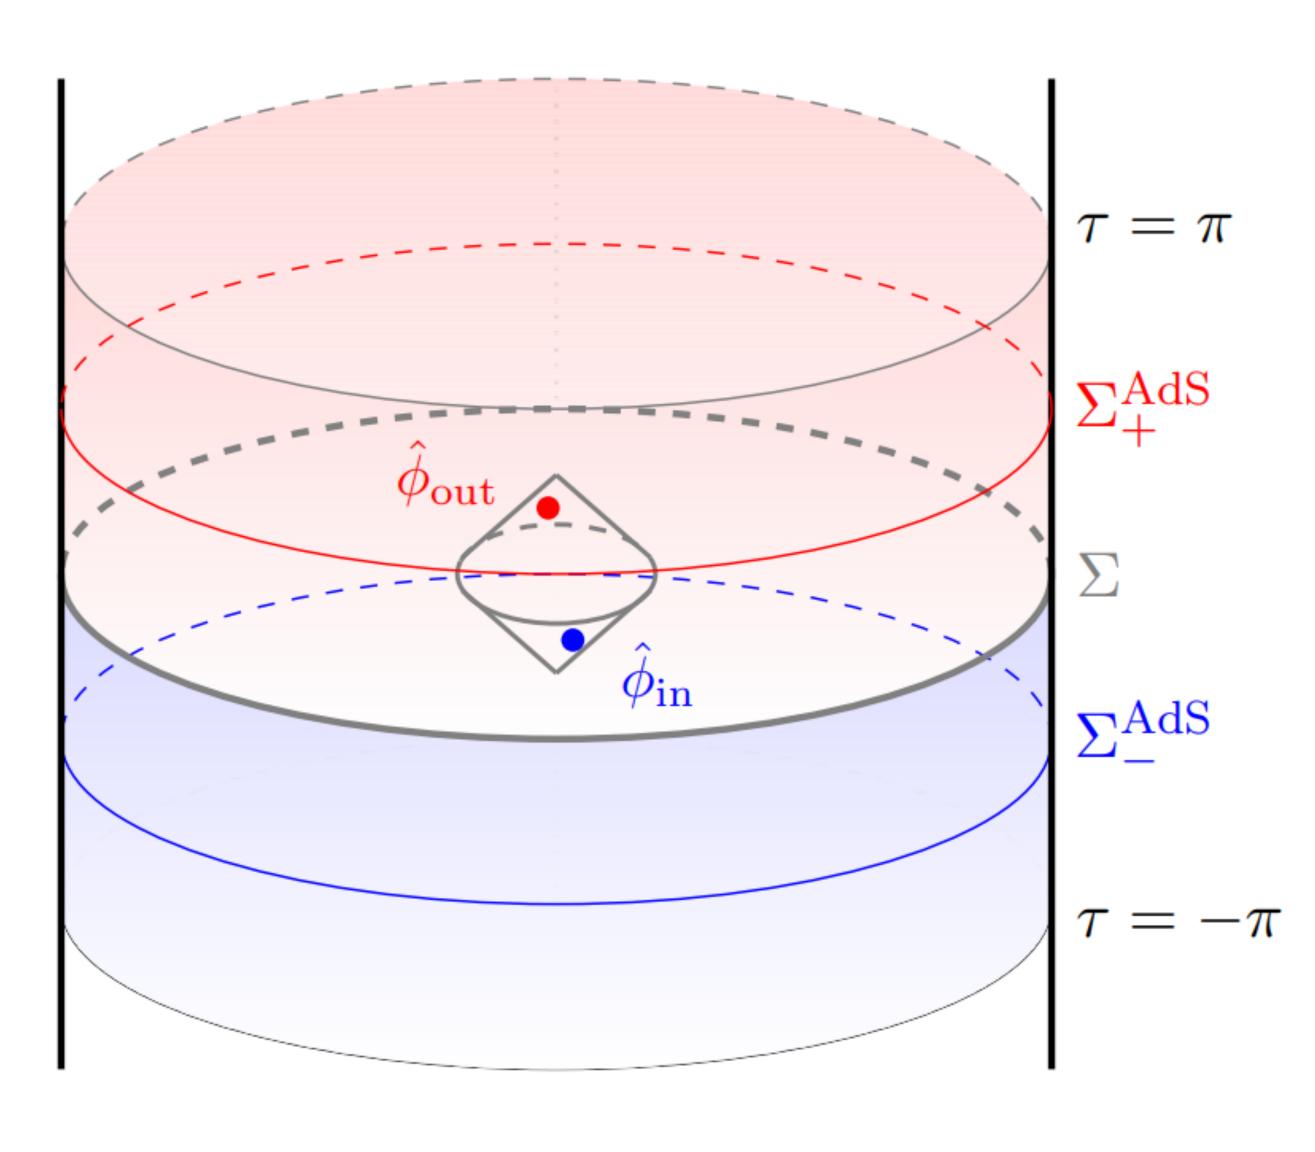

Our approach will be different:

$$|\Psi\rangle = \hat{\Psi}|0\rangle$$

Construct free local bulk operators in the CFT (HKLL)

Extract creation/annihilation operators (Fourier transform)

Take a flat limit (Large AdS radius)

Field can be reconstructed in the CFT using HKLL.

$$\hat{\phi}_{\rm in/out}(\rho, x) = \frac{1}{\pi} \int_{\mathcal{T}} d\tau' \int d^2\Omega \left[K_+(\rho, x; x') \mathcal{O}^+(x') + K_-(\rho, x; x') \mathcal{O}^-(x') \right]$$

Free field in Minkowski space at late/early times.

$$\hat{\phi}(x) = \int \frac{d^3\vec{p}}{(2\pi)^3} \frac{1}{\sqrt{2\omega_{\vec{p}}}} \left(\hat{a}_{\vec{p}} e^{ip\cdot x} + \hat{a}_{\vec{p}}^{\dagger} e^{-ip\cdot x} \right) , \quad \text{with} \quad x \in \text{Mink}_{3+1} .$$

Fock space states can be constructed by acting with creation and annihilation operators.

$$\begin{split} |\vec{k}, \text{in}\rangle &= \sqrt{2\omega_{\vec{k}}} \, \hat{a}_{\text{in},\vec{k}}^{\dagger} |0\rangle \,, \quad \text{and} \quad \langle \vec{p}, \text{out}| = \langle 0|\sqrt{2\omega_{\vec{p}}} \, \hat{a}_{\text{out},\vec{p}} \,. \\ \hat{a}_{\text{in}/\text{out},\vec{p}} &= \lim_{t \to \mp \infty} \frac{i}{\sqrt{2\omega_{\vec{p}}}} \int_{\Sigma} d^3\vec{x} \, e^{-ip \cdot x} \overleftrightarrow{\partial_0} \, \hat{\phi}(x) \,, \\ \hat{a}_{\text{in}/\text{out},\vec{p}}^{\dagger} &= \lim_{t \to \mp \infty} \frac{-i}{\sqrt{2\omega_{\vec{p}}}} \int_{\Sigma} d^3\vec{x} \, e^{ip \cdot x} \overleftrightarrow{\partial_0} \, \hat{\phi}(x) \,. \end{split}$$

Results

Massless fields

$$\sqrt{2\omega_{\vec{p}}} a_{\text{in},\vec{p}} = c_{-} \int_{-\pi}^{0} d\tau \, e^{i\omega_{p}L\left(\tau + \frac{\pi}{2}\right)} \mathcal{O}^{-}\left(\tau, -\hat{p}\right) ,$$

$$\sqrt{2\omega_{\vec{p}}} a_{\text{in},\vec{p}}^{\dagger} = c_{+} \int_{-\pi}^{0} d\tau \, e^{-i\omega_{p}L\left(\tau + \frac{\pi}{2}\right)} \mathcal{O}^{+}\left(\tau, -\hat{p}\right) ,$$

$$\sqrt{2\omega_{\vec{p}}} a_{\text{out},\vec{p}} = c_{+} \int_{0}^{\pi} d\tau \, e^{i\omega_{p}L\left(\tau - \frac{\pi}{2}\right)} \mathcal{O}^{-}\left(\tau, \hat{p}\right) ,$$

$$\sqrt{2\omega_{\vec{p}}} a_{\text{out},\vec{p}}^{\dagger} = c_{-} \int_{0}^{\pi} d\tau \, e^{-i\omega_{p}L\left(\tau - \frac{\pi}{2}\right)} \mathcal{O}^{+}\left(\tau, \hat{p}\right) ,$$

Integrals dominated by windows of size $\mathcal{O}(1/L)$ at $\tau=\pm\frac{\pi}{2}$

Massive fields

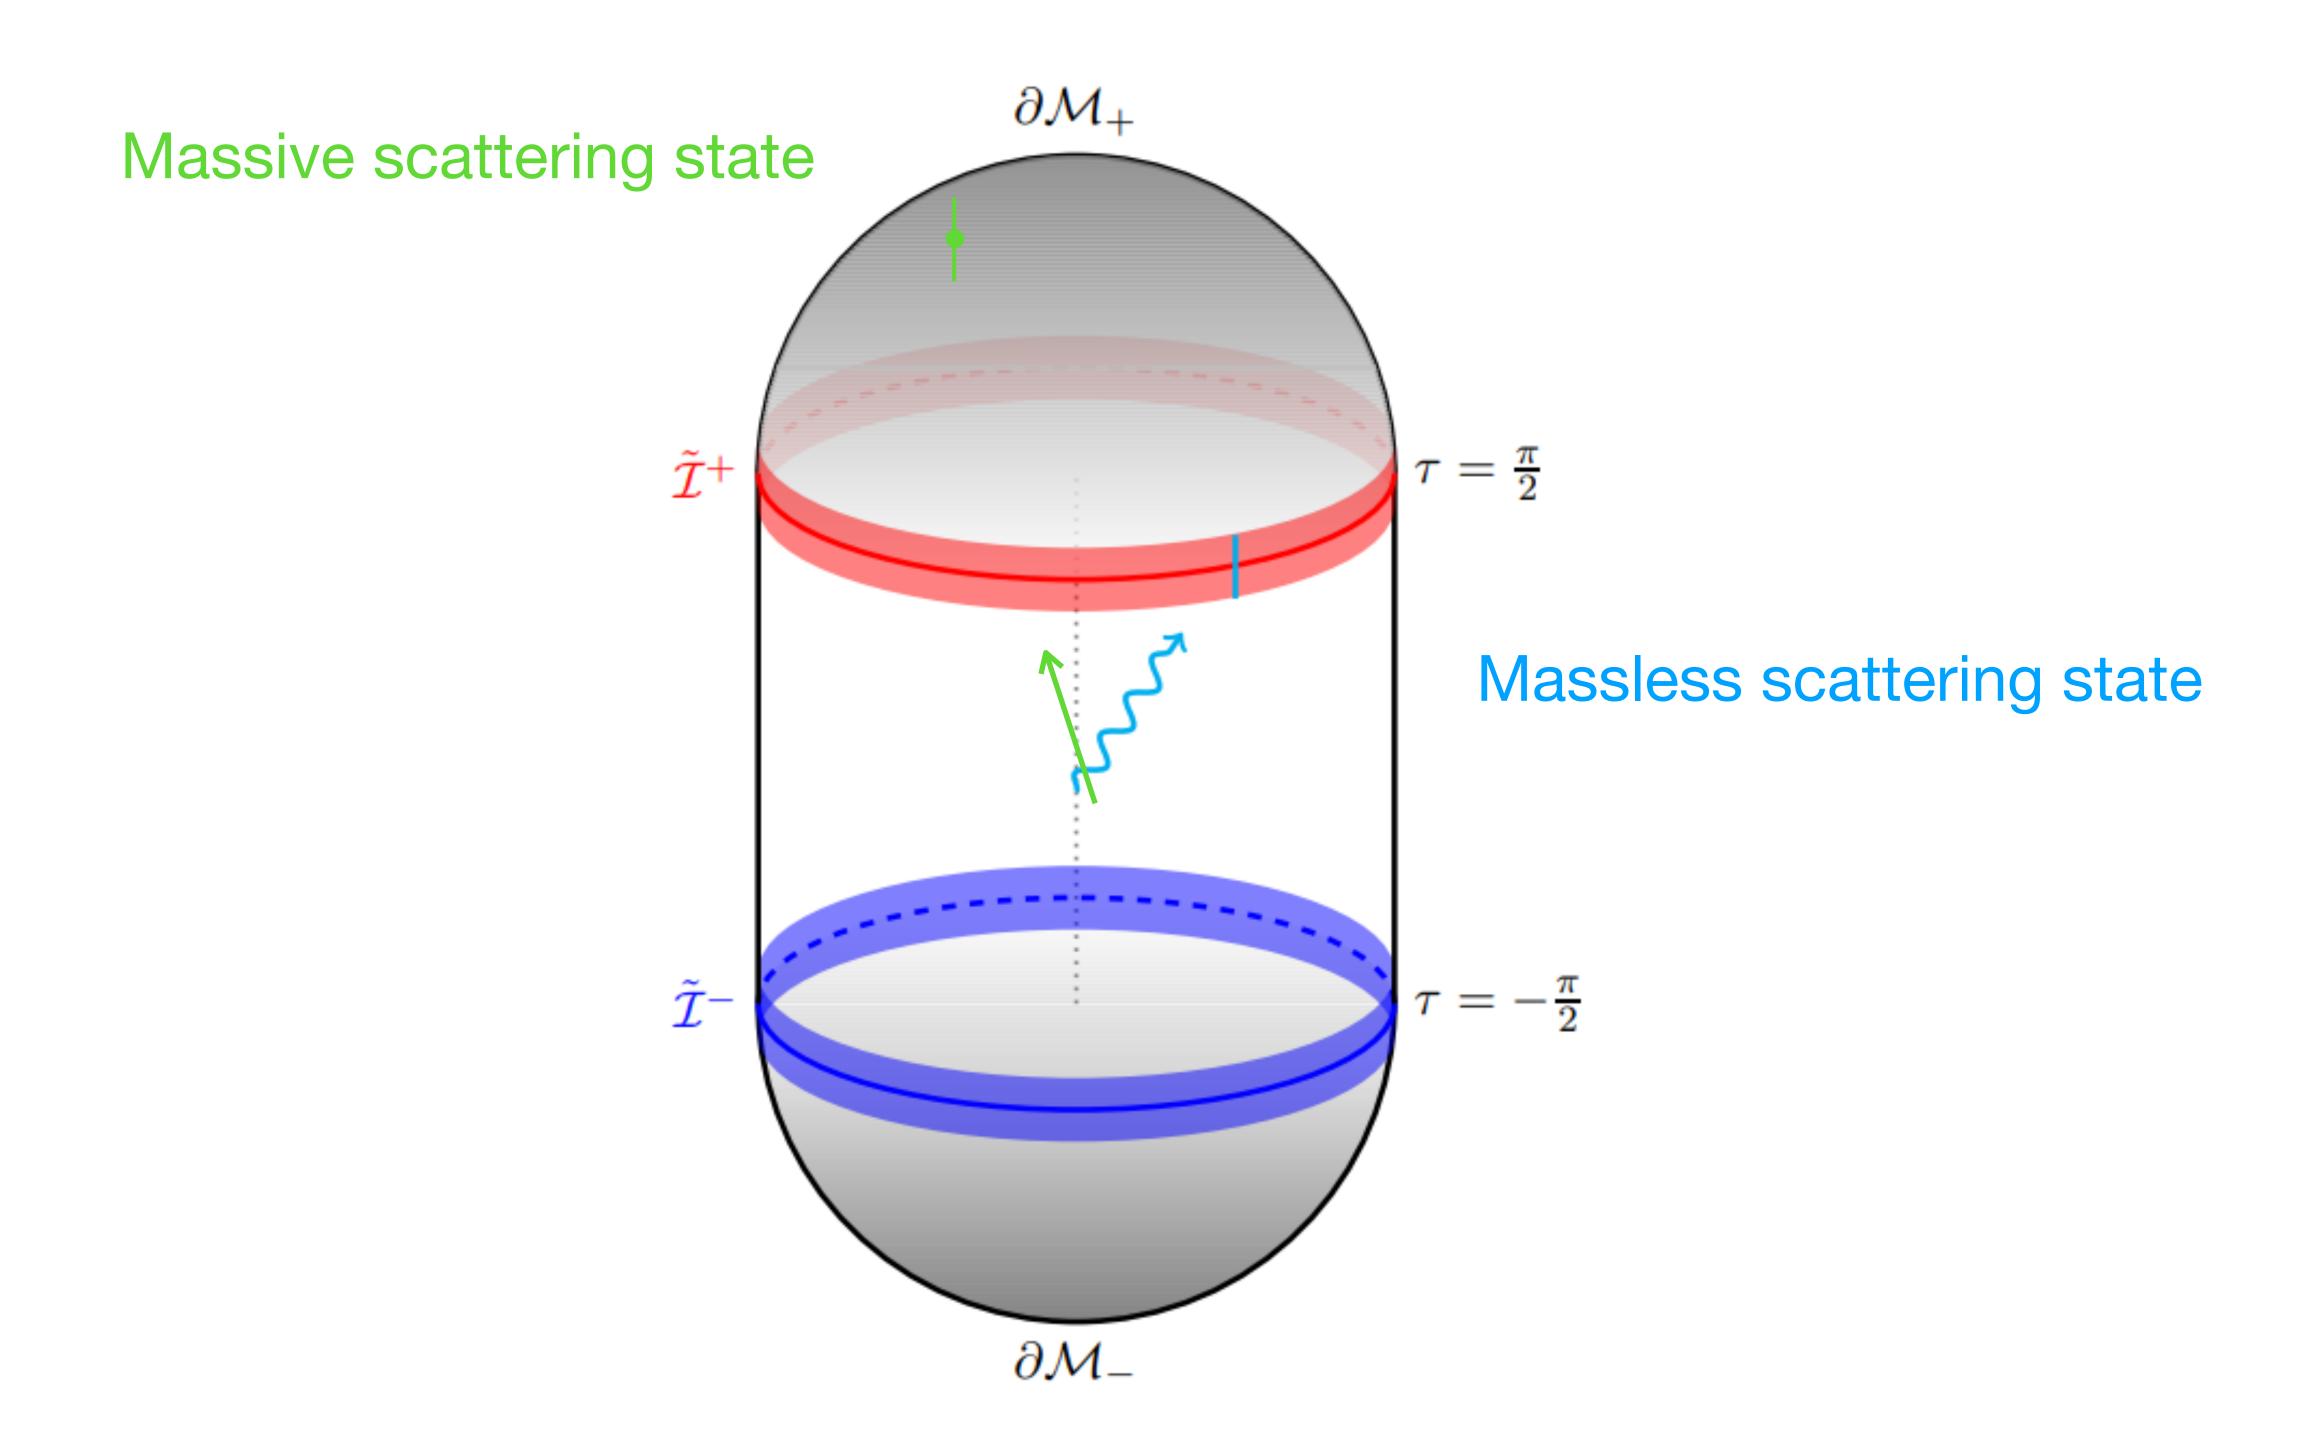

$$m^2L^2 = \Delta(\Delta - d), \quad \Rightarrow \quad \Delta = \frac{d}{2} + mL + \mathcal{O}(L)^{-1}$$

Finite flat space mass involves large CFT operator dimensions

$$\sqrt{2\omega_{\vec{p}}}\hat{a}_{\text{out},\vec{p}}^{\dagger} = c_{-}(L,m,|\vec{p}|) \int_{0}^{\pi} d\tau' e^{i\omega_{\vec{p}}L\left[\frac{\pi}{2} + \frac{i}{2}\log\left(\frac{\omega_{\vec{p}} + m}{\omega_{\vec{p}} - m}\right) - \tau'\right]} \mathcal{O}^{+}(\tau',\hat{p})$$

Integrals dominated by windows of size O(1/L) at

$$\operatorname{Re}(\tau') \sim \frac{\pi}{2} \qquad \operatorname{Im}(\tau') = \frac{1}{2} \log \left(\frac{\omega_{\vec{p}} + m}{\omega_{\vec{p}} - m} \right)$$

Part II - Gauge fields

- What kind of CFT's are dual to U(1) gauge theories in AdS?
- Constructing photon creation/annihilation operators in Minkowski space using CFT
- Weinberg soft theorems as a consequence of CFT Ward identities

Scalar fields in AdS/CFT

Generally, a scalar field has two solutions next to the boundary of AdS

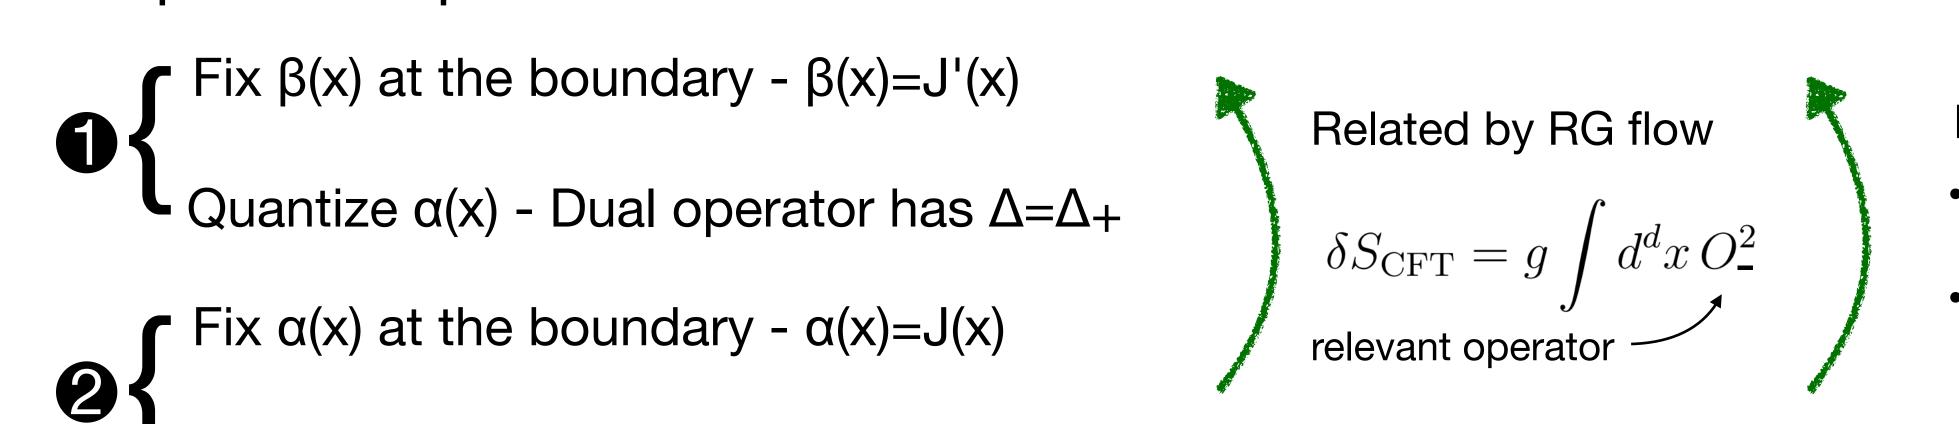

$$\phi(\rho, x) \xrightarrow[\rho \to \frac{\pi}{2}]{} (\cos \rho)^{\Delta_+} \alpha(x) + (\cos \rho)^{\Delta_-} \beta(x)$$

Usually $\beta(x)$ is non-normalizable because $1 - \frac{d^2}{4} > m^2 L^2 > - \frac{d^2}{4}$ In this range, both fall-offs are normalizable Δ_{-} is not positive enough.

$$1 - \frac{d^2}{4} > m^2 L^2 > -\frac{d^2}{4}$$

Two possible quantizations:

Fix $\alpha(x)$ at the boundary - $\alpha(x)=J(x)$ Quantize $\beta(x)$ - Dual operator has $\Delta=\Delta$

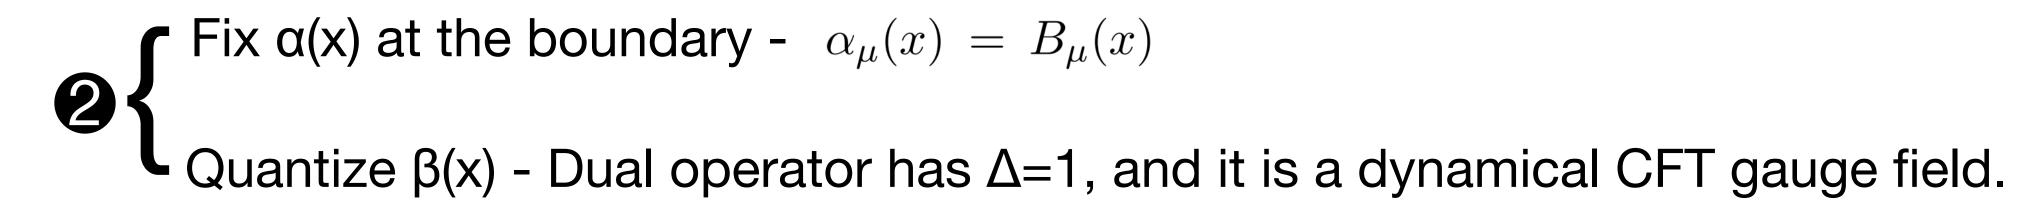

Legendre transform

- Make $\alpha(x)=J(x)$ dynamical
- Couple to new background source J'(x)
- Resulting theory matches $\beta(x)=J'(x)$ theory

U(1) gauge fields in AdS/CFT

Two possible fall-offs
$$\mathcal{A}_{\mu}(\rho,x) \xrightarrow[\rho \to \frac{\pi}{2}]{} (\cos \rho)^{1} \alpha_{\mu}(x) + (\cos \rho)^{0} \beta_{\mu}(x)$$

Two possible quantizations:

Electro-magnetic duality in the bulk ~ Legendre transform in the CFT

Ward identities

Q: What do these Ward identities teach us about flat space-time?

In CFT's of the form the dynamical current obeys a Ward identity

$$\partial_{\mu}\langle 0|T\{j^{\mu}(x)\mathcal{O}(x_1)\cdots\mathcal{O}(x_n)\bar{\mathcal{O}}(y_1)\cdots\bar{\mathcal{O}}(y_m)\}|0\rangle$$

$$= \left(\sum_{i=1}^{n} q_{i} \delta^{(3)}(x - x_{i}) - \sum_{j=1}^{m} q_{j} \delta^{(3)}(x - y_{i})\right) \langle 0|T\{\mathcal{O}(x_{1}) \cdots \mathcal{O}(x_{n})\bar{\mathcal{O}}(y_{1}) \cdots \bar{\mathcal{O}}(y_{m})\}|0\rangle$$

In CFT's of the form 2 The dynamical gauge field A_{μ} can be used to construct a topological current

$$f_{\mu\nu} = \partial_{\mu}A_{\nu} - \partial_{\nu}A_{\mu}$$
 and $(*f)^{\mu} = \frac{1}{2}\epsilon^{\mu\nu\rho}f_{\nu\rho}$

which obeys a Ward identity

$$\partial_{\mu}\langle 0|T\{(*f)^{\mu}(x)\mathcal{M}(x_1)\cdots\mathcal{M}(x_n)\bar{\mathcal{M}}(y_1)\cdots\bar{\mathcal{M}}(y_m)\}|0\rangle$$

$$= \left(\sum_{i=1}^{n} g_i \delta^{(3)}(x - x_i) - \sum_{j=1}^{m} g_j \delta^{(3)}(x - y_i)\right) \langle 0|T\{\mathcal{M}(x_1) \cdots \mathcal{M}(x_n)\bar{\mathcal{M}}(y_1) \cdots \bar{\mathcal{M}}(y_m)\}|0\rangle$$

Constructing flat space creation/annihilation operators using AdS/CFT

In Scattering theory, Fields are considered free asymptotically. We thus focus on free fields.

In Minkowski space, a free U(1) field reads

$$\hat{\mathcal{A}}_{\mu}(x) = \int \frac{d^{3}\vec{q}}{(2\pi)^{3}} \frac{1}{\sqrt{2\omega_{\vec{q}}}} \sum_{\lambda = \pm} \left(\varepsilon_{\mu}^{(\lambda)} \hat{a}_{\vec{q}}^{(\lambda)} e^{iq\cdot x} + \varepsilon_{\mu}^{(\lambda)*} \hat{a}_{\vec{q}}^{(\lambda)\dagger} e^{-iq\cdot x} \right), \quad \text{with} \quad x \in \text{Mink}_{3+1}$$

$$\mathcal{A}_{\mu}(\rho, x) \xrightarrow[\rho \to \frac{\pi}{2}]{} \cos \rho \, j_{\mu}(x)$$

$$\mathcal{V}_{\mu} \xrightarrow{
ho o rac{\pi}{2}} A_{\mu}$$

$$\nabla_{\mu}F^{\mu\nu} = 0$$

$$\mathcal{A}_{\mu}(x) = \int d^3x' \left[K_{\mu}^{V}(\rho, x, x') \, \epsilon_{\tau'}^{ab} \nabla_a j_b^{+}(x') + K_{\mu}^{S}(\rho, x, x') \, \nabla^a j_a^{+}(x') \right] + \text{h.c.}$$

$$\mathcal{A}_{\mu}(x) = \int d^3x' \left[K_{\mu}^{V}(\rho, x, x') \, \epsilon_{\tau'}^{ab} \nabla_a j_b^{+}(x') + K_{\mu}^{S}(\rho, x, x') \, \nabla^a j_a^{+}(x') \right] + \text{h.c.} \qquad \mathcal{V}_{\mu}(x) = \int d^3x' \left[\tilde{K}_{\mu}^{S}(\rho, x; x') \, \epsilon_{\tau'}^{ab} \nabla_a A_b^{+}(x') + \tilde{K}_{\mu}^{V}(\rho, x; x') \, \nabla^a A_a^{+}(x') \right] + \text{h.c.}$$

Flat limit

$$au = \frac{t}{L}$$
, and $\rho = \frac{r}{L}$, with $L \to \infty$.

Fourier transform

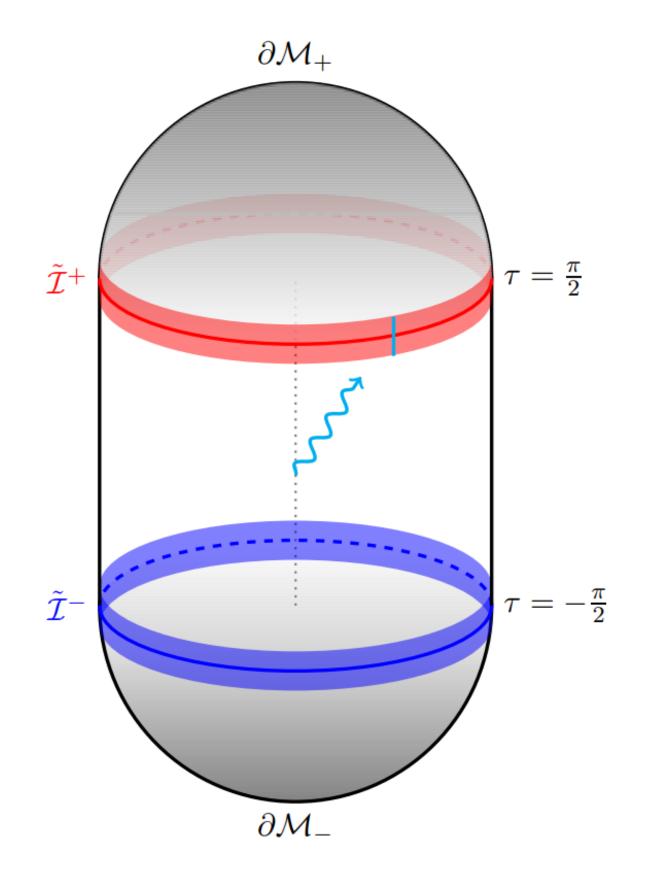

Result

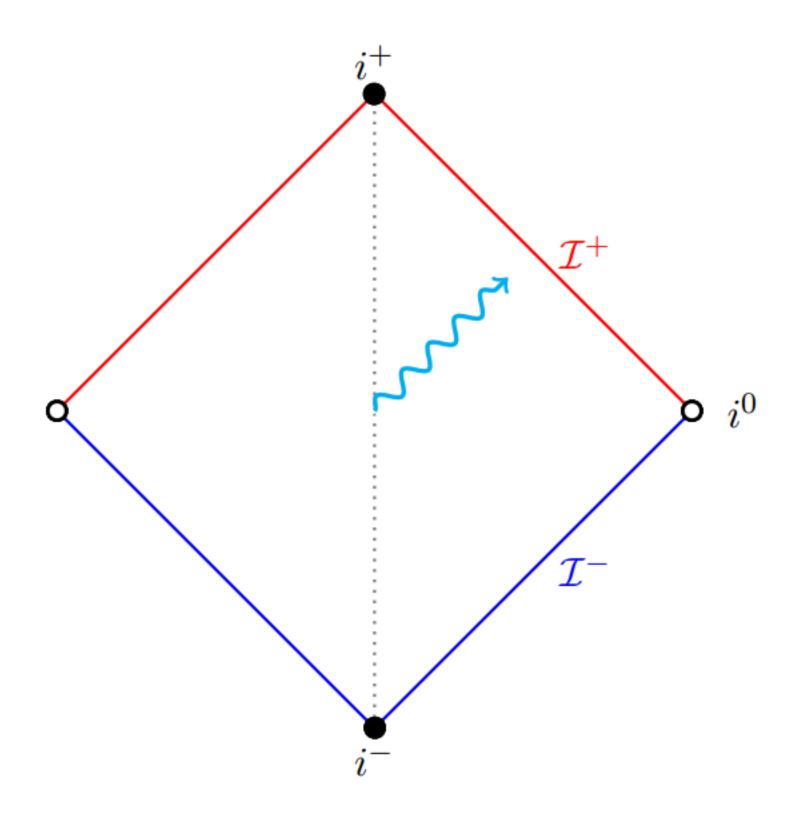

$$\sqrt{2\omega_{\vec{q}}} a_{\vec{q}}^{\dagger(-)} = \frac{-1}{4\omega_{q}} \frac{1 + z_{q}\bar{z}_{q}}{\sqrt{2}} \int d\tau' e^{i\omega_{\vec{q}}L\left(\frac{\pi}{2} - \tau'\right)} \int d^{2}z' \frac{1}{(z_{q} - z')^{2}} j_{\vec{z}'}^{\dagger}(\tau', z', \vec{z}'), \qquad \qquad \sqrt{2\omega_{\vec{q}}} v_{\vec{q}}^{\dagger(-)} = \frac{1}{4\omega_{q}} \frac{1 + z_{q}\bar{z}_{q}}{\sqrt{2}} \int d\tau' e^{i\omega_{\vec{q}}L\left(\frac{\pi}{2} - \tau'\right)} \partial_{\tau'} A_{z'}^{\dagger}(\tau', z', \vec{z}'), \qquad \qquad \sqrt{2\omega_{\vec{q}}} v_{\vec{q}}^{\dagger(-)} = \frac{1}{4\omega_{q}} \frac{1 + z_{q}\bar{z}_{q}}{\sqrt{2}} \int d\tau' e^{i\omega_{\vec{q}}L\left(\frac{\pi}{2} - \tau'\right)} \partial_{\tau'} A_{z'}^{\dagger}(\tau', z', \vec{z}'), \qquad \qquad \sqrt{2\omega_{\vec{q}}} v_{\vec{q}}^{\dagger(+)} = \frac{1}{4\omega_{q}} \frac{1 + z_{q}\bar{z}_{q}}{\sqrt{2}} \int d\tau' e^{i\omega_{\vec{q}}L\left(\frac{\pi}{2} - \tau'\right)} \partial_{\tau'} A_{\vec{z}'}^{\dagger}(\tau', z', \vec{z}', \vec{z}').$$

$$\sqrt{2\omega_{\vec{q}}} v_{\vec{q}}^{\dagger(-)} = \frac{1}{4\omega_{q}} \frac{1 + z_{q}\bar{z}_{q}}{\sqrt{2}} \int d\tau' \, e^{i\omega_{\vec{q}}L\left(\frac{\pi}{2} - \tau'\right)} \partial_{\tau'} A_{z'}^{+}(\tau', z'_{q}, \bar{z}'_{q}),$$

$$\sqrt{2\omega_{\vec{q}}} v_{\vec{q}}^{\dagger(+)} = \frac{1}{4\omega_{q}} \frac{1 + z_{q}\bar{z}_{q}}{\sqrt{2}} \int d\tau' \, e^{i\omega_{\vec{q}}L\left(\frac{\pi}{2} - \tau'\right)} \partial_{\tau'} A_{\bar{z}'}^{+}(\tau', z'_{q}, \bar{z}'_{q}).$$

From CFT physics to Flat physics

Asymptotic symmetries of the S-matrix

The S-matrix is invariant under the action of an infinite set of symmetries

Maxwell equations

There are a family of conserved currents

These yield a family of conserved charges

and
$$dF = *j_M$$

$$*j_E^{\varepsilon} = d(\varepsilon * F)$$

$$*j_M^{\varepsilon} = d(\varepsilon F$$

$$d*F = *j_E, \quad \text{and} \quad dF = *j_M \quad *j_E^{\varepsilon} = d(\varepsilon*F), \quad \text{and} \quad *j_M^{\varepsilon} = d(\varepsilon F) \qquad Q_E^{\varepsilon}(\Sigma) = \int_{\Sigma} *j_E^{\varepsilon} = \int_{\Sigma} (d\varepsilon \wedge *F + \varepsilon * j_E),$$

$$d * j_E = d^2 * F = 0$$
, and $d * j_M = d^2 F = 0$

$$Q_M^{\varepsilon}(\Sigma) = \int_{\Sigma} *j_M^{\varepsilon} = \int_{\Sigma} \left(d\varepsilon \wedge F + \varepsilon * j_M \right) .$$

Conserved in the sense that

$$\langle \operatorname{out}|Q_{E/M}^{\varepsilon}(\Sigma_{+})\mathcal{S} - \mathcal{S}Q_{E/M}^{\varepsilon}(\Sigma_{-})|\operatorname{in}\rangle = 0$$

These charges have a 'soft' (radiative) part and a 'hard' (coulombic) part

$$Q_E^{\text{soft}}(\Sigma_+) = \frac{-1}{8\pi^2} \lim_{\omega_{\vec{q}} \to 0} \omega_{\vec{q}} \int d^2z \, \varepsilon(z, \bar{z}) \left[\partial_{\bar{z}} \left(\frac{\sqrt{2}}{1 + z\bar{z}} \sqrt{2\omega_{\vec{q}}} \, \hat{a}_{\vec{q}}^{(-)} \right) + \partial_z \left(\frac{\sqrt{2}}{1 + z\bar{z}} \sqrt{2\omega_{\vec{q}}} \, \hat{a}_{\vec{q}}^{(+)} \right) \right]$$

$$Q_E^{\text{hard}}(\Sigma_+) = \lim_{t \to \infty} \sum_i q_i \, \varepsilon \left(x \right) \big|_{r = \frac{|\vec{p}|}{p^0} t, \hat{x} = \hat{p}_i}$$

Conservation of the charges relates S-matrices with soft photons to S-matrices without them.

$$\varepsilon(x) = \frac{1}{z - z'},$$

$$\varepsilon(x) = \frac{1}{\overline{z} - \overline{z}'}$$

Choosing
$$\varepsilon(x) = \frac{1}{z - z'}$$
, and $\varepsilon(x) = \frac{1}{\bar{z} - \bar{z}'}$ and assuming $F_{z\bar{z}}|_{\mathcal{I}_{-}^{+}} = F_{z\bar{z}}|_{\mathcal{I}_{+}^{-}} = 0$ yields

=
$$\langle {\rm out} | \sqrt{2\omega_{\vec{q}}} \, a_{\vec{q}}^{(\pm)} \mathcal{S} | {\rm in} \rangle \sim$$

$$= \langle \text{out} | \sqrt{2\omega_{\vec{q}}} \, a_{\vec{q}}^{(\pm)} \mathcal{S} | \text{in} \rangle \sim \left[\sum_{i} q_{i} \frac{p_{i} \cdot \epsilon^{\pm}}{p_{i} \cdot q} - \sum_{i} q_{j} \frac{p_{j} \cdot \epsilon^{\pm}}{p_{j} \cdot q} \right] \langle \text{out} | \mathcal{S} | \text{in} \rangle$$

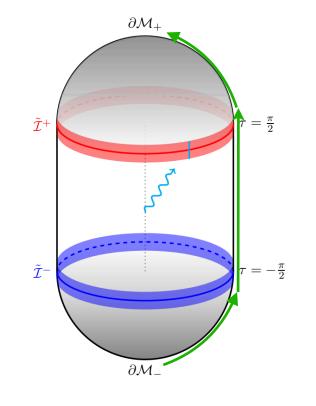

Objective: Derive these formulas using CFT Ward identities and the map between scattering states and CFT operators we have constructed.

From CFT physics to Minkowski physics

Starting point: Integrated form of Ward identity

Integration region:

$$\int d^3x \, \alpha(x) \partial_\mu \langle 0 | T\{j^\mu(x)X\} | 0 \rangle = \underbrace{\left(\sum_{i=1}^n q_i \alpha(x_i) - \sum_{j=1}^m q_j \alpha(y_j) \right) \langle 0 | T\{X\} | 0 \rangle}_{\text{RHS}} \qquad X = \prod_i \mathcal{O}_i(x_i) \prod_j \bar{\mathcal{O}}_i(y_j)$$

- 1. Smear locations of operators such that they become creation/annihilation operators in flat space
- 2. Make a choice of parameter $\alpha(x)$ such that RHS becomes the hard part of Weinberg's theorem

$$\alpha(x) = \lim_{\rho \to \frac{\pi}{2}} \int d^2 \hat{x}' \frac{1}{4\pi} \frac{\cos^2 \rho - \cos^2 \tau}{\left(\sin \tau - \sin \rho \, \hat{x} \cdot \hat{x}'\right)^2} \varepsilon(\hat{x}')$$

$$\alpha(x)|_{\tilde{\tau}^{\pm}} = \varepsilon(\hat{x})$$
yields RHS = $\langle \text{out} | Q_E^{\text{hard}}(\Sigma_+) \mathcal{S} - \mathcal{S} \, Q_E^{\text{hard}}(\Sigma_-) | \text{in} \rangle$

3. Integrate by parts the LHS

$$\int d^3x\,\partial_{\mu}\alpha(x)\langle 0|T\{j^{\mu}(x)X\}|0\rangle = \int_{\partial\mathcal{M}_{\pm}}d^3x\,\partial_{\mu}\alpha(x)\langle 0|T\{j^{\mu}(x)X\}|0\rangle \qquad \text{Wietchert potentials in AdS} \\ -\int_{\tilde{\mathcal{I}}^{\pm}}d^3x\,\varepsilon(\hat{x})\left[D^z\langle 0|T\{j_z(x)X\}|0\rangle + D^{\bar{z}}\langle 0|T\{j_{\bar{z}}(x)X\}|0\rangle\right] \ . \end{cases} \qquad \text{Only radiative parts of the argued again by computing LW potentials explicitly.} \\ =\int_{\tilde{\mathcal{I}}^{\pm}}d^3x\,\varepsilon(\hat{x})\left[D^z\langle 0|T\{j_z^{(\mathrm{R})}(x)X\}|0\rangle + D^{\bar{z}}\langle 0|T\{j_{\bar{z}}^{(\mathrm{R})}(x)X\}|0\rangle\right] \ . \end{cases}$$

Can be argued away by computing Lienard-

Only radiative parts of the argued again by computing LW potentials explicitly.

4. The operators appearing in LHS are soft photon operators according to our map!

$$\int_{\tilde{\mathcal{I}}^{+}} d^{3}x \,\varepsilon(\hat{x}) D^{\bar{z}} j_{\bar{z}}^{-} = \lim_{\omega_{\vec{q}} \to 0} \frac{2}{\pi} \omega_{\vec{q}} \int d^{2}z_{q} \,\varepsilon(\hat{q}) \,\partial_{\bar{z}_{q}} \left(\frac{\sqrt{2}}{1 + z\bar{z}} \sqrt{2\omega_{\vec{q}}} \,a_{\vec{q}}^{(-)} \right) ,$$

$$\int_{\tilde{\mathcal{I}}^{+}} d^{3}x \,\varepsilon(\hat{x}) D^{z} j_{z}^{-} = \lim_{\omega_{\vec{q}} \to 0} \frac{2}{\pi} \omega_{\vec{q}} \int d^{2}z_{q} \,\varepsilon(\hat{q}) \,\partial_{z_{q}} \left(\frac{\sqrt{2}}{1 + z\bar{z}} \sqrt{2\omega_{\vec{q}}} \,a_{\vec{q}}^{(+)} \right) .$$

So LHS corresponds to the insertion of soft charge operators: LHS = $\langle \text{out}|Q_E^{\text{soft}}(\Sigma_+)\mathcal{S} - \mathcal{S}\,Q_E^{\text{soft}}(\Sigma_-)|\text{in}\rangle$

5. Putting all the pieces together yields

$$\langle \operatorname{out}|Q_E^{\operatorname{soft}}(\Sigma_+)\mathcal{S} - \mathcal{S} Q_E^{\operatorname{soft}}(\Sigma_-)|\operatorname{in}\rangle = \langle \operatorname{out}|Q_E^{\operatorname{hard}}(\Sigma_+)\mathcal{S} - \mathcal{S} Q_E^{\operatorname{hard}}(\Sigma_-)|\operatorname{in}\rangle$$

or simply

$$\langle \operatorname{out}|Q_E^{\varepsilon}(\Sigma_+)\mathcal{S} - \mathcal{S} Q_E^{\varepsilon}(\Sigma_-)|\operatorname{in}\rangle = 0$$

In order to show Weinberg soft theorems one proceeds as in flat space, but an extra assumption concerning the radiative modes must be made!

$$F_{z\bar{z}}|_{\mathcal{I}_{-}^{+}} = F_{z\bar{z}}|_{\mathcal{I}_{+}^{-}} = 0$$

Magnetic asymptotic symmetries from Ward identities

$$\partial_{\mu}\langle 0|T\{(*f)^{\mu}(x)X\}|0\rangle = \left(\sum_{i=1}^{n}g_{i}\delta^{(3)}(x-x_{i}) - \sum_{j=1}^{m}g_{j}\delta^{(3)}(x-y_{j})\right)\langle 0|T\{X\}|0\rangle$$
 Integrate by parts
$$2i\int_{\hat{\mathbb{I}}^{\pm}}d\tau d^{2}z\,\varepsilon(\hat{x})\left[\partial_{z}\langle 0|T\{\partial_{\tau}A_{z}(x)X\}|0\rangle - \partial_{z}\langle 0|T\{\partial_{\tau}A_{z}(x)X\}|0\rangle\right] \qquad \alpha(x) = \lim_{\rho \to \frac{\pi}{2}}\int d^{2}\hat{x}'\,\frac{1}{4\pi}\frac{\cos^{2}\rho - \cos^{2}\tau}{(\sin\tau - \sin\rho\,\hat{x}\cdot\hat{x}')^{2}}\varepsilon(\hat{x}')$$
 Use map between CFT operators and scattering states
$$\left\langle \operatorname{out}|Q_{M}^{\operatorname{soft}}(\Sigma_{+})\,\mathcal{S} - \mathcal{S}\,Q_{M}^{\operatorname{soft}}(\Sigma_{-})|\operatorname{in}\rangle \right. \\ \left\langle \operatorname{out}|Q_{M}^{\operatorname{hard}}(\Sigma_{+})\,\mathcal{S} - \mathcal{S}\,Q_{M}^{\operatorname{hard}}(\Sigma_{-})|\operatorname{in}\rangle = 0$$

Some Questions

• Gravity: Scattering states involving gravitons from the CFT perspective.

Soft theorems from Stress tensor Ward identities

Aside: EM duality story in the gravity case. Are CFT legendre transforms related to T^2 deformations?

BMS₄ algebra from a flat limit of AdS/CFT

• Relaxing the condition for asymptotic decoupling involves including interactions in our definition of scattering states. This should yield Faddeev-Kulish asymptotic states and an IR finite S-matrix in the flat limit.

Thanks!
